

KalshiTradingBot

Setup & Connection Guide

Thank you for your purchase! Follow these steps to get your bot live and trading. The whole process takes about 15–20 minutes.

■■ **Do this first:** Fund your Kalshi account before starting the bot. The bot cannot trade if your balance is \$0.

1

Create a GitHub Account (if you don't have one)

Go to **github.com** and sign up for a free account. You just need a username, email, and password.

2

Create & Fund Your Kalshi Account

- Go to **kalshi.com** and sign up.
- Once logged in, go to **Wallet** → **Deposit**.
- Add funds using your **debit card** — deposits clear within minutes.

3

Get Your Kalshi API Key

The bot needs an API key to trade on your behalf. Here's how to get it:

- In Kalshi, open **Account Settings**.
- Go to the **Developer** section.
- Click **API Keys** → **Create New Key**.
- Copy the key — **store it somewhere safe**, you won't see it again.

4

Fork the Trading Bot Repository

While logged in to GitHub, visit:

github.com/InTheNightRaider/KalshiTradingBot

- Click the **Fork** button in the top-right corner.
- **Make it private immediately:** in your forked repo go to **Settings** → **Danger Zone** → **Change visibility** → **Private**. This keeps your API key secure.

Add Your API Key to the Repository

Still in your forked repo on GitHub, navigate to:

Settings → **Secrets and variables** → **Actions** → **New repository secret**

5

Set the secret like this:

Name	Value
KALSHI_API_KEY	Paste your Kalshi API key here

Sign Up on the Dashboard & Enter Your API Key

6

Go to the dashboard website link provided to you and sign up for an account. **Google sign-in is the preferred option.**

Once inside, enter your **Kalshi API key** into the dashboard. This lets the dashboard read your live portfolio data and display your positions.

Connect GitHub with a Personal Access Token (PAT)

To let the dashboard communicate with your private repo, you need to generate a GitHub Personal Access Token (PAT):

7

- On GitHub, click your profile photo → **Settings**.
- Scroll to **Developer settings** → **Personal access tokens** → **Tokens (classic)**.
- Click **Generate new token (classic)**.
- Give it a name, set an expiration, and check the **repo** scope.
- Click **Generate token** and copy it.

Then paste the PAT into the **Connect GitHub** field on the dashboard.

Start the Bot

8

Everything is connected. Hit **Start Bot** on the dashboard.

If everything is set up correctly you'll see a success confirmation. The bot will read your Kalshi portfolio, apply your trading size, and begin trading automatically.

■ **Happy Trading!**
